DETAILED ACTION

This Application has been examined. The claims 21-28 are pending. The examination results are as following.

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 21-26 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chatigny et al. (US 5,673,041) in view of Selig et al. (US 6,492,978).

Regarding claim 21, Chatigny et al. discloses in figs 1-2, a feedback mechanism for an acoustic wave switch (see abstract) having a touch sensitive surface (touch region 24) comprising a surface (18) overlaying the touch sensitive surface of the acoustic wave switch, the surface (18) in an unactuated position being spaced from the touch sensitive surface (24) of the switch, and an acoustic wave absorbing material (see finger at the surface 18 by absorbing some of the ultrasonic energy, see col. 4, lines 10-15) disposed between the surface (18) and the touch sensitive surface such that in response to a force acting on the substrate (16), the surface (18) contacts the absorbing material, and absorbing material contacts the touch sensitive surface of the acoustic wave switch with sufficient pressure to actuate the acoustic wave switch (see col. 4, lines 10-19).

Application/Control Number: 09/998,220

Art Unit: 2677

However, Chatigny et al. does not disclose a deformable dome overlaying the touch sensitive surface. Selig et al. discloses in figs 1-4 that a touch screen (16) having a dome (see key (24, fig. 1, 4) disposed over the touch screen (16, fig. 4, see col. 5, and lines 48-51).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to implement the using of the key disposed over the touch screen as taught by Selig et al. into the system of Chatigny et al. because this would be suitable modified for this type of touch screen to interrupt the acoustic signal by using the individual keys and also provide tactile feedback as desired to the user (see col. 8,lines 25-29).

Regarding claims 22-23, Chatigny et al. further discloses the acoustic wave absorbing material is mounted on the surface is mounted on a surface (see finger at the surface 18 by absorbing some of the ultrasonic energy, see col. 4, lines 10-15). However, Chatigny et al. does not discloses the dome is overlaying the touch surface.

Selig et al. discloses in figs. 1-4, a dome (24) is overlaying the touch surface (touch screen 16, see key 24, fig. 4).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to implement the using of the key disposed over the touch screen as taught by Selig et al. into the system of Chatigny et al. because this would be suitable modified for this type of touch screen to interrupt the acoustic signal by using the individual keys and also provide tactile feedback as desired (see col. 8, lines 24-29).

Regarding claim 24, Chatigny et al. discloses in figs 1-2 a feedback mechanism for an acoustic wave switch having a touch sensitive surface (touch region 24) comprising: a surface (18) overlying the touch sensitive surface (24) of the acoustic wave switch and an acoustic wave

Art Unit: 2677

absorbing material mounted on the surface (see finger at the surface 18 by absorbing some of the ultrasonic energy, see col. 4, lines 10-15), the acoustic wave absorbing material being spaced from the touch sensitive surface of the acoustic wave switch (see col. 4, lines 10-15) when the surface actuator is in an unactuated position and the acoustic wave absorbing material contacting

the touch sensitive surface of the switch actuating the acoustic wave switch in response to a force

sensitive surface of the acoustic wave switch (see col. 4, lines 35-43).

However, Weigers et al. does not disclose an actuator overlaying the touch sensitive surface. Selig et al. discloses in figs 1-4, a touch system having an actuator overlaying the touch

surface (see key 24, fig. 1, 4, see abstract, see col. 5, lines 48-51).

acting on the surface (18) to move the acoustic wave absorbing material contact with the touch

It would have been obvious to one of ordinary skill in the art at the time the invention was made to implement the using of the actuator disposed over the touch screen as taught by Selig et al. into the system of Chatigny et al. because this would be suitable modified for this type of touch screen to interrupt the acoustic signal by using the individual keys and also provide tactile feedback as desired to the user (see col. 4, lines 24-29).

Regarding claims 25-26, 28, Chatigny et al. does not disclose the actuator is a defomable dome and is a truncated dome, and the actuator includes a plunger extending through an aperture in a metal plate.

Selig et al. discloses in fig. 4, the actuator is a defomable dome and is a truncated dome (see fig. 4), and the actuator includes a plunger extending through an aperture in a metal plate (see figs. 6, 8).

Application/Control Number: 09/998,220 Page 5

Art Unit: 2677

It would have been obvious to one of ordinary skill in the art at the time the invention was made to implement the actuator is a deformable dome and is a truncated dome, and the actuator includes a plunger extending through an aperture in a metal plate as taught by Selig into the system of Chatigny et al. because this would be suitable modified for this type of touch screen to interrupt the acoustic signal by using the individual keys and also provide tactile feedback as desired to the user (see col. 4, lines 24-29).

Allowable Subject Matter

- 3. Claim 27 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 4. The following is a statement of reasons for the indication of allowable subject matter:

 None of the cited art teaches or suggests a feedback mechanism for an acoustic wave switch as recited in claim 24, wherein the actuator includes a rocker having a pivot with a magnet mounted on the rocker on a first side of the pivot to hold the actuator in an actuated position and the magnet returns the actuator to the unactuated position when force is removed.

Correspondence

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kimnhung Nguyen whose telephone number is (571) 272-7698. The examiner can normally be reached on MON-FRI, FROM 8:30 AM-5:30 PM.

Application/Control Number: 09/998,220 Page 6

Art Unit: 2677

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Edouard can be reached on (571) 272-7603. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
